

Normalized work-cycle distribution of segment clusters

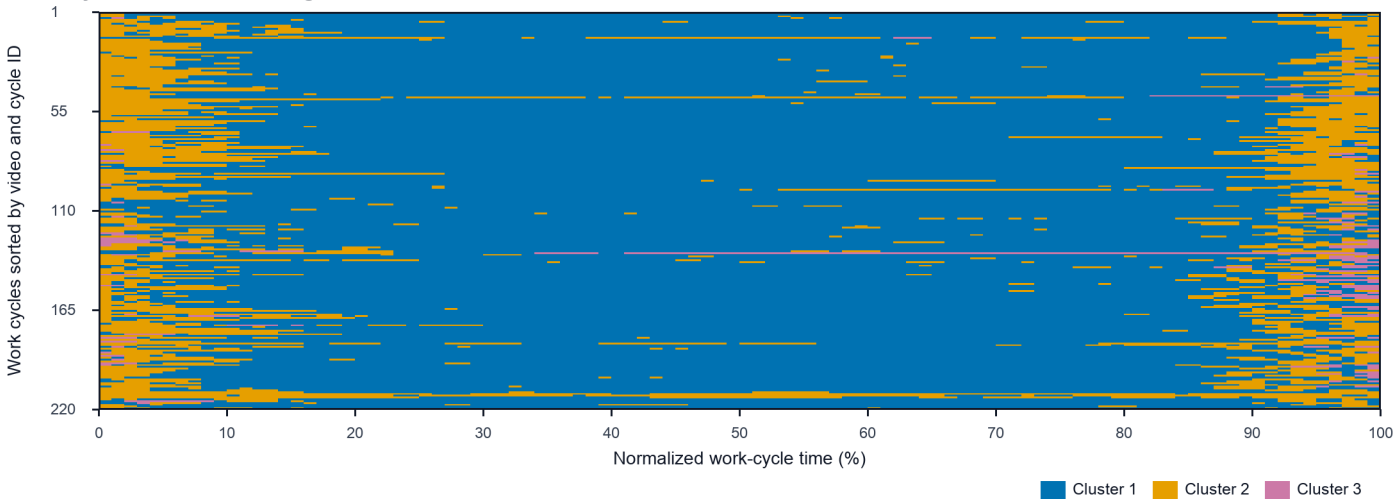

Task A zipper sewing; segment positions normalized from 0% to 100% within each complete work cycle

A Window-level cluster probability across normalized work-cycle time

Probabilities are calculated in 2% normalized-time bins and shown with a 3-bin moving average.

B Cycle-level raster of segment clusters

n = 220 work cycles; 28,187 window-level segments assigned to complete work-cycle intervals.
Interpretation should be paired with post hoc visual review of representative segments from each cluster.
